INDUSTRIAL NOTES.

THE TRUSSED CONCRETE STEEL CO., of Detroit, Mich., is putting on the market a new bar for reinforcing concrete called a "cup-bar," rolled with rectangular depression or cups on its four faces. It is also marketing a rectangular mesh type of expanded metal in seven sizes with meshes 2 ins. to 8 ins. square, and weighing 2 lbs. to ½ lb. per sq. ft.

J. H. WAGENHORST & CO., Youngstown, Ohio, manufacturers of electric blue printing machines, report the following sales: Thomson Stationery Co., Vancouver, B. C.; Department of Forestry, Ottawa, Ont.; New Jersey Zinc Co., New York; James Clark, Jr., & Co., St. Louis, Mo.; Howe Engineering Co., New York; Great Western Sugar Co., Ft. Collins, Colo.; Builders Exchange, St. Paul, Minn.; C. N. Dunham, Philadelphia, Pa.

THE EXPANDED METAL ENGINEERING COMPANY, which, for eleven years has been located at 256 Broadway, has removed its offices to the new Brunswick Building, 225 Fifth Ave., New York. The Brunswick Building is to contain the permanent exhibit of the Concrete Association of America, and as Mr. Merrill Watson, Manager of the Expanded Metal Engineering Co., is one of the Vice-Presidents of the Concrete Association, the move was an advantageous one.

THE FISHER HYDRAULIC STONE AND MACHINERY COMPANY, of Baltimore, Md., has sold a complete outfit of hydraulic stone-making machinery to Messrs. Thomas D. Ridley & Sons, leading contractors and manufacturers, of Middlesborough, England. The plant will be located at the works of the company—South Bank, near Middlesborough—and is expected to be in operation about July 1. It will have a capacity of from 1,500 to 3,000 cu. ft. of wall stone, steps, large sills, window sills and lintels and other special stone. The manufacture of large dimension stone will be a prominent feature of the business. The order for this machinery was placed by Mr. Thomas W. Ridley, President of the company, after inspecting the machinery at Baltimore.

THE NORTHWEST ENGINEERING CO., 153 La Salle St., Chicago, has recently completed its organization and has arranged the personnel of its engineering forces with reference to doing particularly effective work as constructing and contracting engineers in all branches of the business. The company will undertake surveys, estimates and reports on existing and projected electric and steam railways, the construction and superintendence of power plants and central stations, also the erection of bridges and buildings and structures of reinforced concrete. Water supply, sewers and sewage disposal and kindred problems will be handled by specialized engineers. The engineering talent and experience that has become associated in the management of this company gives promise of thorough and economical methods in the handling of its contracts, the first of which are now being vigorously pushed. Mr. R. C. Canterbury is secretary of the company and managing engineer, at the address mentioned above.

THE L. J. WING MFG. CO., 90 West St., New York City, report increasing sales of its newly-patented Wing's turbine fan. This fan is the combination of two well-known machines, the Wing disk fan, and a well-designed turbine engine. The same is the invention of Mr. L. J. Wing, President of the L. J. Wing Mfg. Co., who originally invented and patented the disk fan, of which there are many thousands in use in this and other countries. The L. J. Wing Mfg. Co. has been putting them on the market over a year, and has met with great success, finding large demand for such a combination. The blades of the fan are practically the same as those used on the well-known Wing disk fan when used for ventilation, run by belt, electric motor, or direct connected old type engine. The turbine engine consists of a series of well designed turbine buckets or vanes fastened to a band or ring, which in turn is fastened to the end of the periphery of the fan blades. Two or more nozzles of special design impinge the steam into the buckets, and causes the fan to r otate. This gives an economical and positive power.
